

1:1 Device Management

Secure Device Management for Schools

Empower Students With Secure 1:1 Devices

The Internet is the fastest growing communications medium available in education today. To keep up with the modern world requires technology that advances student's engagement in the curriculum. One of the many technology tools used to provide students with new learning engagements is the one-to-one device program. The one-to-one device program is an essential tool in a student's learning process because it provides them with self-directed technology. But without proper device management, schools face unnecessary security risks that may set back students.

RDI provides a one-on-one customer specific management service to protect your network against potential unwanted logins to your system, increase the strength of a secure and stable network, and works to alleviate struggles that

come with Bring Your Own Device (BYOD) programs and configurations. Our team is also inclusive of Mobile Device Management (MDM) to support all devices – smartphones, tablets, laptops, desktops, and more.

Better Technology Opportunities For Students

With countless devices connected to a network, it can quickly become overwhelming to manage multiple device endpoints consistently. Without constant device management, out-of-date devices may circumvent network security and can introduce any number of extraneous threats – including malware, ransomware, etc. Whether the devices are provided by the school or as part of a BYOD program, it is critical to ensure that all devices connecting to a network are secure and up-to-date. With RDI device management and network architecture design, our team

of security experts can efficiently and cost effectively map out your network and manage your network devices to ensure all network components are secure. Ranging from one device to hundreds, RDI can customize device management plans that fit your specific needs.

Secure & Protect Your Devices

RDI's expert engineers provide schools with long-term device management. With comprehensive network management tools, our team actively monitors all aspects of your network devices while also maintaining and updating all devices. Our team can deploy device management easily and remotely, saving you a considerable amount of IT resources. When paired with secure data backup (321-Backup®), security and patch management (AssuredSecurity™), and backup Internet connectivity (RocketFailover™), RDI can ensure that your network maintains peak performance and security 24/7/365.

Primary Features:

- Tailored Solutions For Your Data Network Needs
- In-depth Evaluations
- World-Class Support & Training
- Guaranteed Response Times
- Remote & Onsite Diagnostics & Services
- Mobile Device Management (MDM) Support
- Custom Long-Term Management Plans
- Hardware Management & Device Updates
- Integrated Security Services
- Network Architecture Mapping
- Intelligent Network Monitoring & Response
- Optional Data Backup & Windows Device Security
- Active Device Verification & Updates
